## 0.1 Computing gradient problems

1. Find the derivative/gradient of the following functions:

(a) 
$$f: \mathbb{R}^n \to \mathbb{R}$$

$$f(x) = a^{ op} x$$

(b) 
$$f: \mathbb{R}^n \to \mathbb{R}^m$$

$$f(x) = Ax$$

(c) 
$$f: \mathbb{R}^n \to \mathbb{R}$$

$$f(x) = x^{\top} A x$$

(d) 
$$f: \mathbb{R}^n \to \mathbb{R}$$

$$f(x) = rac{e^{a^ op x}}{1 + e^{a^ op x}}$$

(e) 
$$f: \mathbb{R}^n \to \mathbb{R}$$

$$f(x) = ||Ax - b||_2^2$$

(f) 
$$f: \mathbb{R}^n \to \mathbb{R}^n$$

$$f_i(x) = rac{e^{x_i}}{\displaystyle\sum_{j=1}^n e^{x_j}}$$

(g) 
$$f: \mathbb{R}^n_{>0} \to \mathbb{R}$$

$$f(x) = \sum_{i=1}^n x_i \ln rac{x_i}{lpha_i}$$

## 0.2 Basic Optimization problems

1. Let  $\mathcal{C} \subseteq \mathbb{R}^n$  be the solution set of the quadratic inequality

$$\mathcal{C} = \{x \in \mathbb{R}^n | x^\top A x + b^\top x + c < 0\}$$

with  $A \in \mathbb{R}^{n \times n}$ ,  $b \in \mathbb{R}^n$  and  $c \in \mathbb{R}$ 

- (a) Show that C is convex if  $A \geq 0^1$
- (b) Show that the intersection of C and the hyperplane defined by  $\alpha \cdot x + \beta = 0 \ (\alpha \neq 0)$  is convex if  $A + \lambda_0 \alpha \alpha^\top \geq 0$  for some  $\lambda_0 \in \mathbb{R}$ .
- 2. Show that  $x = (1, \frac{1}{2}, \underbrace{4})$  is optimal solution for the minimization problem  $\min_{x} \quad \frac{1}{2}x^{\top}Ax + b^{\top}x + c$ s.t. -1 < x < 1, i = 1, 2, 3

where 
$$A = \begin{bmatrix} 13 & 12 & -2 \\ 12 & 17 & 6 \\ -2 & 6 & 12 \end{bmatrix}$$
,  $b = \begin{bmatrix} -22 \\ -14.5 \\ 13 \end{bmatrix}$  and  $c = 1$ .

3. Consider the problem of minimizing the function  $f:\mathbb{R}^n \to R$  which is defined as

$$f(x) = rac{||Ax-b||_2^2}{c^ op x+d},$$

where  $Dom(f) = \{x | c^\top x + d > 0\}$ . Assume that rank(A) = r and  $b \notin R(A)$ . Show that the minimizer  $x^*$  of f is given by  $x^* = x_1 + x_2$ , where  $x_1 = (A^\top A)^{-1}A^\top b$ ,  $x_2 = (A^\top A)^{-1}c$  and  $t \in \mathbb{R}$ .

4. Suppose the convex function f satisfies

$$mI < \nabla^2 f(x) < MI \ (0 < m < M < \infty),$$

I being the identity function. Let  $\nabla x$  be a descent direction at x, show that the backtracking stopping condition holds for

$$0 < t \le -rac{
abla f(x) \cdot 
abla x}{M||x||_2^2}$$

Use this number to give an upper bound on the number of backtracking iterations.

5. Consider the quadratic objective function on  $\mathbb{R}^2$ 

$$f(x)=rac{1}{2}x_1^2+rx_2^2,$$

where r > 0. Apply the gradient descent method with exact line search starting at a point x(0) = (r, 1) and find closed form expression for  $f(x_k)$ .

 $<sup>^{1}</sup>A$  being positive semi-definite is denoted as A > 0.
